

ADVENTIST UNIVERSITY OF CENTRAL AFRICA

SQL Query Execution Assignment I Rubric

Course: Database Development with PL/SQL INSY 8311

Instructor: Eric Maniraguha | ericmaniraguha2024@gmail.com | [LinkedIn Profile](#)

Assignment Date: September 19, 2024

Group A, B, E, F

Assignment I Task:

1. **Install Oracle Database Administration:**
 - Follow the installation guide to set up Oracle Database on your machine.
 - Ensure the database is configured correctly and can be accessed via Oracle SQL Developer.
2. **Execute SQL Commands in Oracle Database:**
 - **System Management System:**
 - Design a conceptual diagram illustrating the tables with relationships (one-to-one, one-to-many, or many-to-many).
 - **Create Tables:** Implement the relationships defined in your diagram.
 - **SQL Commands:** Write and execute SQL commands to:
 - Create the tables from your diagram.
 - Insert, update, and delete data.
 - Perform joins to retrieve related data across tables.
 - Use DDL, DML, DCL, and TCL operations.
 - Execute basic SQL commands (SELECT, INSERT, UPDATE, DELETE).
 - Perform joins and subqueries.
3. **Upload Your Script to GitHub:**
 - **GitHub Account:** If you don't have one, sign up here.
 - **Set Up a Repository:**
 - Create a new repository (e.g., oracle-sql-tests).
 - **Upload Your Script:**
 - Save your SQL commands in a file (e.g., sql_test_script.sql).
 - Upload the file to your GitHub repository.
 - **Create a README File:**
 - Include a problem statement that describes the system you are managing with your database (e.g., a system for managing a library, employee records, etc.).
 - Provide a description of the SQL commands executed.
 - Add screenshots of your SQL queries, results, and your conceptual diagram.
 - Provide clear explanations of the results and transactions.
4. **Submission:**
 - Provide the link to your GitHub repository where the SQL script, README file, and the conceptual diagram are uploaded.

Criteria	Excellent (3 pts)	Good (2 pts)	Fair (1 pt)	Needs Improvement (0 pts)
Installation of Oracle Database	Oracle Database is installed correctly and fully operational, with successful connection and configuration.	Oracle Database is installed with minor issues that do not significantly impact operation.	Installation has notable issues that affect the operation or connection of the database.	Installation is incomplete or fails to operate correctly, hindering further tasks.
Conceptual Diagram and Table Relationships	Conceptual diagram includes at least four related tables with accurate relationships, reflected in the SQL implementation.	Conceptual diagram includes four tables with minor errors; relationships mostly implemented in SQL.	Conceptual diagram includes fewer than four tables or lacks clarity; relationships not fully reflected in SQL.	No conceptual diagram, or relationships between tables are poorly designed or absent in SQL.
Execution of SQL Commands	SQL commands execute without errors; correct use of DDL, DML, DCL, TCL, joins, subqueries, and basic commands.	Most SQL commands execute correctly, with minor errors or omissions.	Some SQL commands result in errors or incorrect outputs.	Many SQL commands result in errors or incorrect outputs.
Adherence to Requirements	Fully meets all requirements: table creation, relationships, transactions, joins, and DDL, DML, DCL, TCL commands.	Meets most requirements with minor omissions or errors in execution.	Meets some requirements but lacks essential components or transactions.	Fails to meet many requirements, with significant omissions or errors.
GitHub Repository and README	Repository is set up correctly; SQL script, README with problem statement, and conceptual diagram are uploaded; README includes detailed descriptions, screenshots, and results.	Repository is set up correctly; README includes results and some screenshots.	Repository setup is incomplete; README lacks sufficient detail.	Repository setup is missing or README lacks necessary content, problem statement, and screenshots.
Code Organization and Clarity	SQL code is well-organized, formatted neatly, and includes comments for clarity.	SQL code is organized, with some comments for clarity.	SQL code is somewhat disorganized or lacks comments, affecting readability.	SQL code is poorly organized, making it difficult to understand.

Total Points: /10

Additional Notes:

1. Problem Statement: Provide a problem statement in the README that describes the system being managed by the database.
2. Conceptual Diagram: Include a diagram that shows at least four related tables with relationships.
3. Results: Show the output of SQL queries and transactions.
4. Screenshots: Include screenshots of SQL queries, results, and your conceptual diagram.
5. Submission: Submit your assignment using this [Google Form](#), you will need to provide:
 - Your Names
 - Your Student ID
 - The link to the public GitHub repository with your SQL script, README file, problem statement, and conceptual diagram.

Deadline: September 26, 2024 at 11h59 pm.

Late submissions will be penalized by deducting 3 points before grading.

Important: Make sure you enter the correct information when filling out the submission form. Any mistakes in selecting your group or submitting the wrong project link will also result in penalties.

This rubric provides a structured framework for evaluating the assignment, covering installation, SQL execution, and documentation.

Good luck with your assignment! If you need any more help, feel free to reach out.
